Overview

- Some Definitions
- Some *Instruments* to consider
 - Research and Broader Impacts
 - Discussion

Some Definitions

Network

Computer Network:

A computer network is a group of computer systems and other computing hardware devices that are linked together through communication channels to facilitate communication and resource-sharing among a wide range of users.

- <https://www.techopedia.com/definition/25597/computer-network>

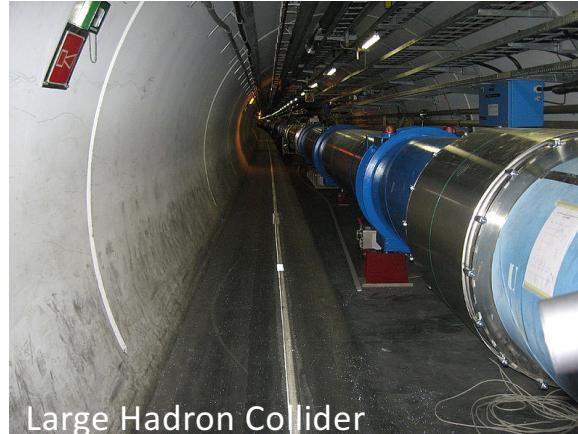

Instrument

Scientific Instrument:

“A scientific instrument is an instrument used for scientific purposes. Most are measurement instruments. They may be specifically designed, constructed and refined for the purpose. Over time, instruments have become more accurate and precise.”

- Increasingly – instruments are network connected and integrated into Laboratory Information Systems

- https://en.wikipedia.org/wiki/Scientific_instrument

Large Hadron Collider

Very Large Array

Data

"Data: For the purposes of this Memorandum, the term "data" refers to all structured information, unless otherwise noted. " – OMB Memorandum [M-13-13](#)

"All data necessary to understand, assess, and extend the conclusions of the manuscript must be available to any reader of Science. All computer codes involved in the creation or analysis of data must also be available to any reader of Science."

— Science General Information for

Authors — [Data and Materials Availability Statement](#)

"Data (/ˈdeɪtə/ day-tə, /dætə/ da-tə, or /dɑ:tə/ dah-tə) is a set of values of qualitative or quantitative variables; restated, pieces of data are individual pieces of information. Data is measured, collected and reported, and analyzed, whereupon it can be visualized using graphs or images. Data as a general concept refers to the fact that some existing information or knowledge is represented or coded in some form suitable for better usage or processing." - <https://en.wikipedia.org/wiki/Data>

Computation

Computational science (also scientific computing or scientific computation) is a rapidly growing multidisciplinary field that uses advanced computing capabilities to understand and solve complex problems. Computational science fuses three distinct elements:

- Algorithms (numerical and non-numerical) and modeling and simulation software developed to solve science (e.g., biological, physical, and social), engineering, and humanities problems
- Computer and information science that develops and optimizes the advanced system hardware, software, networking, and data management components needed to solve computationally demanding problems
- The computing infrastructure that supports both the science and engineering problem solving and the developmental computer and information science

- https://en.wikipedia.org/wiki/Computational_science

Collaboration

Research Collaboration Currently has a number of dimensions:

- Communication – web and video conferencing
- Data management and sharing
- Document development
- Resource sharing
- All potentially across large distances

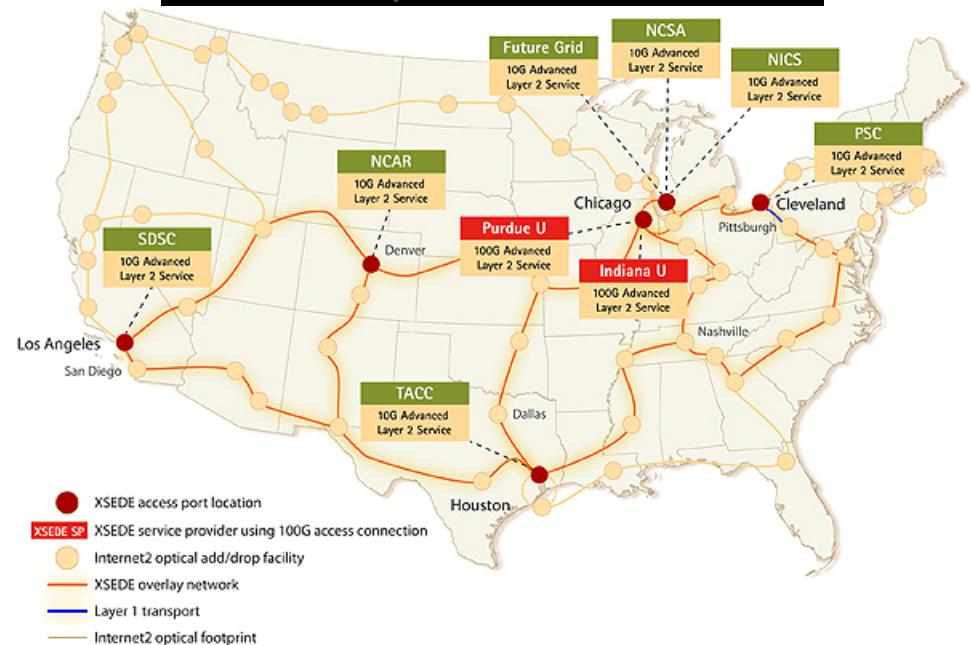

Some Instruments to Consider

Computation – High Performance Computing

The XSEDE network is an example of a collection of network connected computational resources

- Compute Resources
- Visualization
- Storage
- High-throughput computing
- Other services

Computation – On-demand Computing (i.e. cloud computing)

Both public and private cloud computing may be used to effectively scale up non-HPC computational resources on an as needed, “pay-as-you-go”

- Tasks easily distributed to many individual computers
- Development and testing platforms
- Platform/Infrastructure As a Service

Computation - Distributed

Computation can also be distributed throughout ad-hoc networks of contributing computers. Examples include:

- The HTCondor project from the University of Wisconsin
- Berkeley Open Infrastructure for Network Computing (BOINC) project from UC Berkeley

Data – Collaborative Data Sharing

A variety of public and private cloud solutions enable collaborative data sharing

- Dropbox
- Google Drive
- Amazon S3
- OwnCloud

Amazon S3

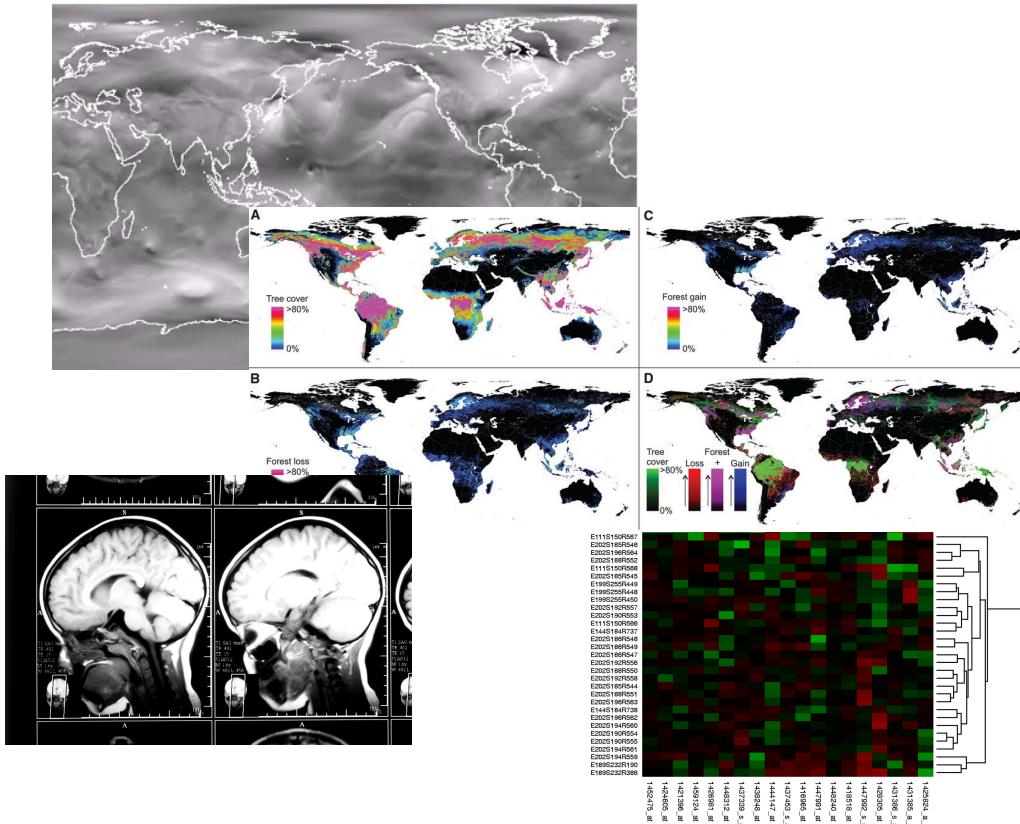

Data – Streaming Data

Data may be generated in a continuous fashion and made available as continuously updated streams or frequently updated snapshots

- Data from instruments
- Data from user interactions with systems

Data – High Volume Observational or Model Data

Some data sources produce huge volumes of data that must be transferred from one location to another, for example

- Satellite Imagery
 - Climate and weather models
 - Medical imaging
 - Genomics

Data – Replication, Backup & Preservation

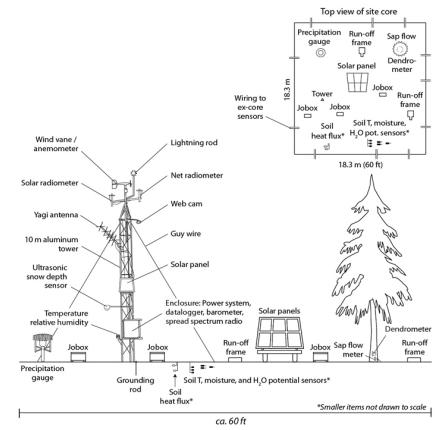

Large volumes of data may need to be transferred between facilities to meet data security, access and preservation needs

- Replication for efficient local access
- Backup and disaster planning
- Long-term preservation of access

Data – Remote Control

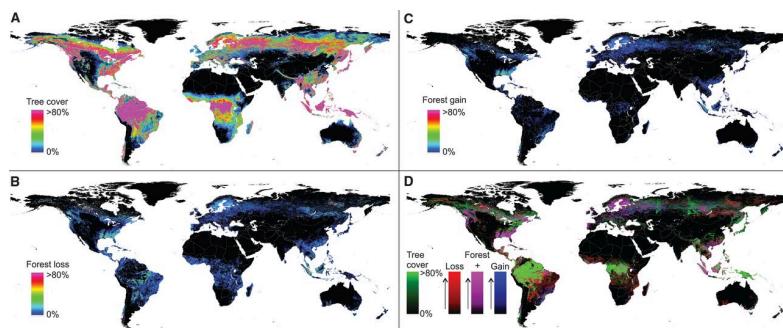

Network connectivity with sensor systems can enable remote control capabilities for those sensors

The image shows a camera management interface with a live video feed of a snowy forest. On the left, there's a vertical zoom control with three options: "40x Tele", "Zoom", and "1x Wide". The main video area displays a dense forest of snow-covered trees. At the bottom, there are several control buttons: a green square labeled "Watching", a "Preset" dropdown menu, a "Snap" button, and a "Home" link.

Data & Computation – Co-location

An increasingly important model for data-intensive science is to co-locate data and computational capabilities to maximize analytic performance

High-Resolution Global Maps of 21st-Century Forest Cover Change

M. C. Hansen,^{1*} P. V. Potapov,¹ R. Moore,² M. Hancher,² S. A. Turubanova,¹ A. Tyukavina,¹ D. Thau,² S. V. Stehman,³ S. J. Goetz,⁴ T. R. Loveland,⁵ A. Kommareddy,⁶ A. Egorov,⁶ L. Chini,¹ C. O. Justice,¹ J. R. G. Townshend¹

Quantification of global forest change has been lacking despite the recognized importance of forest ecosystem services. In this study, Earth observation satellite data were used to map global forest loss (2.3 million square kilometers) and gain (0.8 million square kilometers) from 2000 to 2012 at a spatial resolution of 30 meters. The tropics were the only climate domain to exhibit a trend, with forest loss increasing by 2101 square kilometers per year. Brazil's well-documented reduction in deforestation was offset by increasing forest loss in Indonesia, Malaysia, Paraguay, Bolivia, Zambia, Angola, and elsewhere. Intensive forestry practiced within subtropical forests resulted in the highest rates of forest change globally. Boreal forest loss due largely to fire and forestry was second to that in the tropics in absolute and proportional terms. These results depict a globally consistent and locally relevant record of forest change.

128.8 M km²
143 Billion 30m pixels
654,178 Landsat 7 ETM+ Scenes

“... one million CPU-core hours on 10,000 computers ...”

Collaboration

The increasing focus on collaborative interdisciplinary research yields a demand for effective tools for collaboration and communication

- Audio and video conferencing
- Desktop sharing
- Shared access to data and documents
- Shared document production

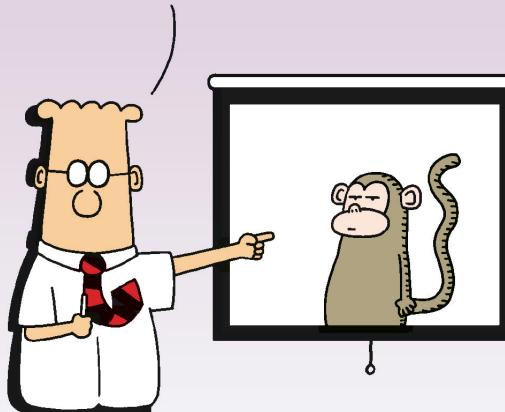

Research and Broader Impacts

IF WE MIGRATE OUR ENTERPRISE APPLICATIONS TO THE WEB, AND OUTSOURCE OUR SALES AND PRODUCT DEVELOPMENT...

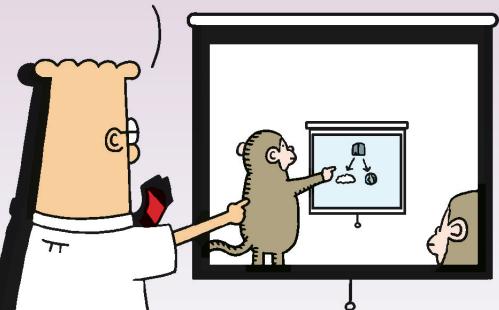

Dilbert.com DilbertCartoonist@gmail.com

THE ENTIRE COMPANY CAN BE MANAGED BY ONE MONKEY.

PLUS A SECOND MONKEY TO LOOK AT THE POWERPOINT SLIDES FROM THE FIRST MONKEY.

Discoverability

Network accessible data require machine readable documentation (metadata) to allow for discovery at scale through a variety of systems

The screenshot shows the DATA.GOV Data Catalog homepage. At the top, there's a search bar and navigation links for DATA, TOPICS, IMPACT, APPLICATIONS, DEVELOPERS, and CONTACT. Below the header, a large search result summary is displayed: "126,405 datasets found". Under this, several dataset cards are shown, each with a thumbnail, title, and a "View in dataset" link. The first card is for "U.S. Hourly Precipitation Data". The second card is for "Great Chile Earthquake of May 22, 1960 - Anniversary Edition". The third card is for "National Park Boundaries". The fourth card is for "Military Installations, Ranges, and Training Areas". Each card also includes a "View Details" link.

Sustainability of Digital Formats
Planning for Library of Congress Collections

[Search this site](#) [Go](#)

[Introduction](#) | [Sustainability Factors](#) | [Content Categories](#) | [Format Descriptions](#) | [Contact](#)

The Digital Formats Web site provides information about digital content formats. The analyses and resources presented here will increase and be updated over time. The compilers, Caroline R. Arms, Carl Fleischhauer, and Kate Murray invite [feedback](#) on the content.

Introduction
Background information and overview: What is a format? How shall we evaluate formats? What projects in other organizations are addressing these questions? >>

[Overview](#) | [Formats, Evaluation Factors, and Relationships](#) | [Papers and Presentations](#) | [Related Resources](#)

Sustainability Factors
What affects the ability of the Library to preserve content in a given format? These sustainability factors apply to all formats. >>

[Disclosure](#) | [Adoption](#) | [Transparency](#) | [Self-documentation](#) | [External Dependencies](#) | [Impact of Patents](#) | [Technical Protection Mechanisms](#)

Content Categories
The evaluation of formats must take into account quality and functionality. These factors vary according to the type of content under consideration and the categories will be expanded as time passes. >>

[Still Image](#) | [Sound](#) | [Textual](#) | [Moving Image](#) | [Web Archive](#) | [Datasets](#) | [Geospatial](#) | [Generic](#)

Format Descriptions
Documents with more information about specific formats. >>

[Browse categories](#) | [Browse alphabetical list](#) | [Format Descriptions as XML](#)

To maximize impact data must be accessible in formats that are broadly usable, easily preserved and well documented for understanding and use

- Open standards
- Well documented
- Self-documenting
- Robust

<http://www.digitalpreservation.gov/formats/index.shtml>

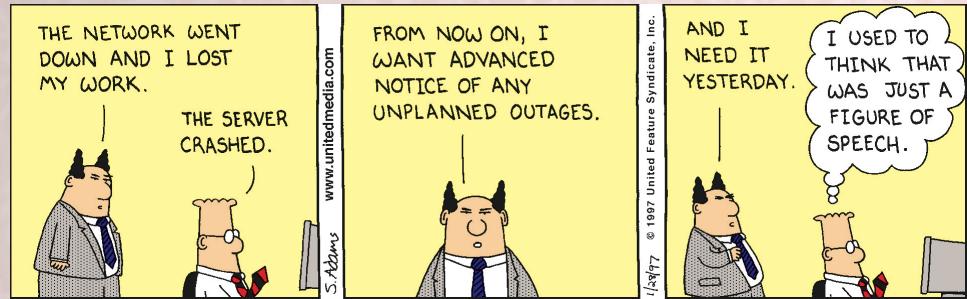

Access – Data Access, Analysis & Visualization Services

Data access, analysis and visualization services enable “smart” data access and use – making otherwise difficult to use data usable and set the stage for apps through an API (Application Programming Interface).

**REST -
Representational State Transfer**

**SOAP -
Simple Object Access Protocol**
